“The Colegio de Farmacéuticos de Puerto Rico is accredited by the Accreditation Council for Pharmacy Education as a provider of continuing pharmacy education.”

Provider Number: 0151

Objectives

1. Discuss the pathophysiologic relations between metabolic conditions, cardio, and renal associated diseases
2. Identify risk reduction strategies to prevent cardio-renal-metabolic comorbidities
3. Discuss evidence-based data that support the use of medications to prevent cardio-renal-metabolic comorbidities
4. Describe place in therapy of the different pharmacologic interventions to prevent and manage metabolic-cardio-renal comorbidities
5. Analyze the differences in incretin-based, sodium-glucose cotransporter 2 inhibitors and other therapies related to cardiorenal protection
6. Explain risks and benefits of medications in people with diabetes, heart failure, and/or chronic kidney disease to prevent or manage comorbidities
7. Value the role of the pharmacist as a member of the interprofessional team caring for these patients

Pre-Test

1. Guidelines are shifting from treatment of diabetes as the only condition to reduction of overall cardio-renal-metabolic comorbidities. True or False
2. To reduce overall mortality in patients with T2D, sitagliptin is preferred in those with HF or CKD. True or False
3. In patients with high risk of ASCVD or with established CVD, GLP-1RAs and SGLT2is are preferred agents. True or False
4. Clinical pharmacists can help identify patients with diabetes who may benefit from GLP-1 RAs or SGLT2is to optimize their glycemic control and provide positive cardiorenal benefits. True or False
5. Pharmacists can educate team members on the benefits and risks of SGLT2 inhibitors or GLP-1RA beyond glycemic control. True or False

Cardiovascular- Kidney- Metabolic (CKM) Syndrome

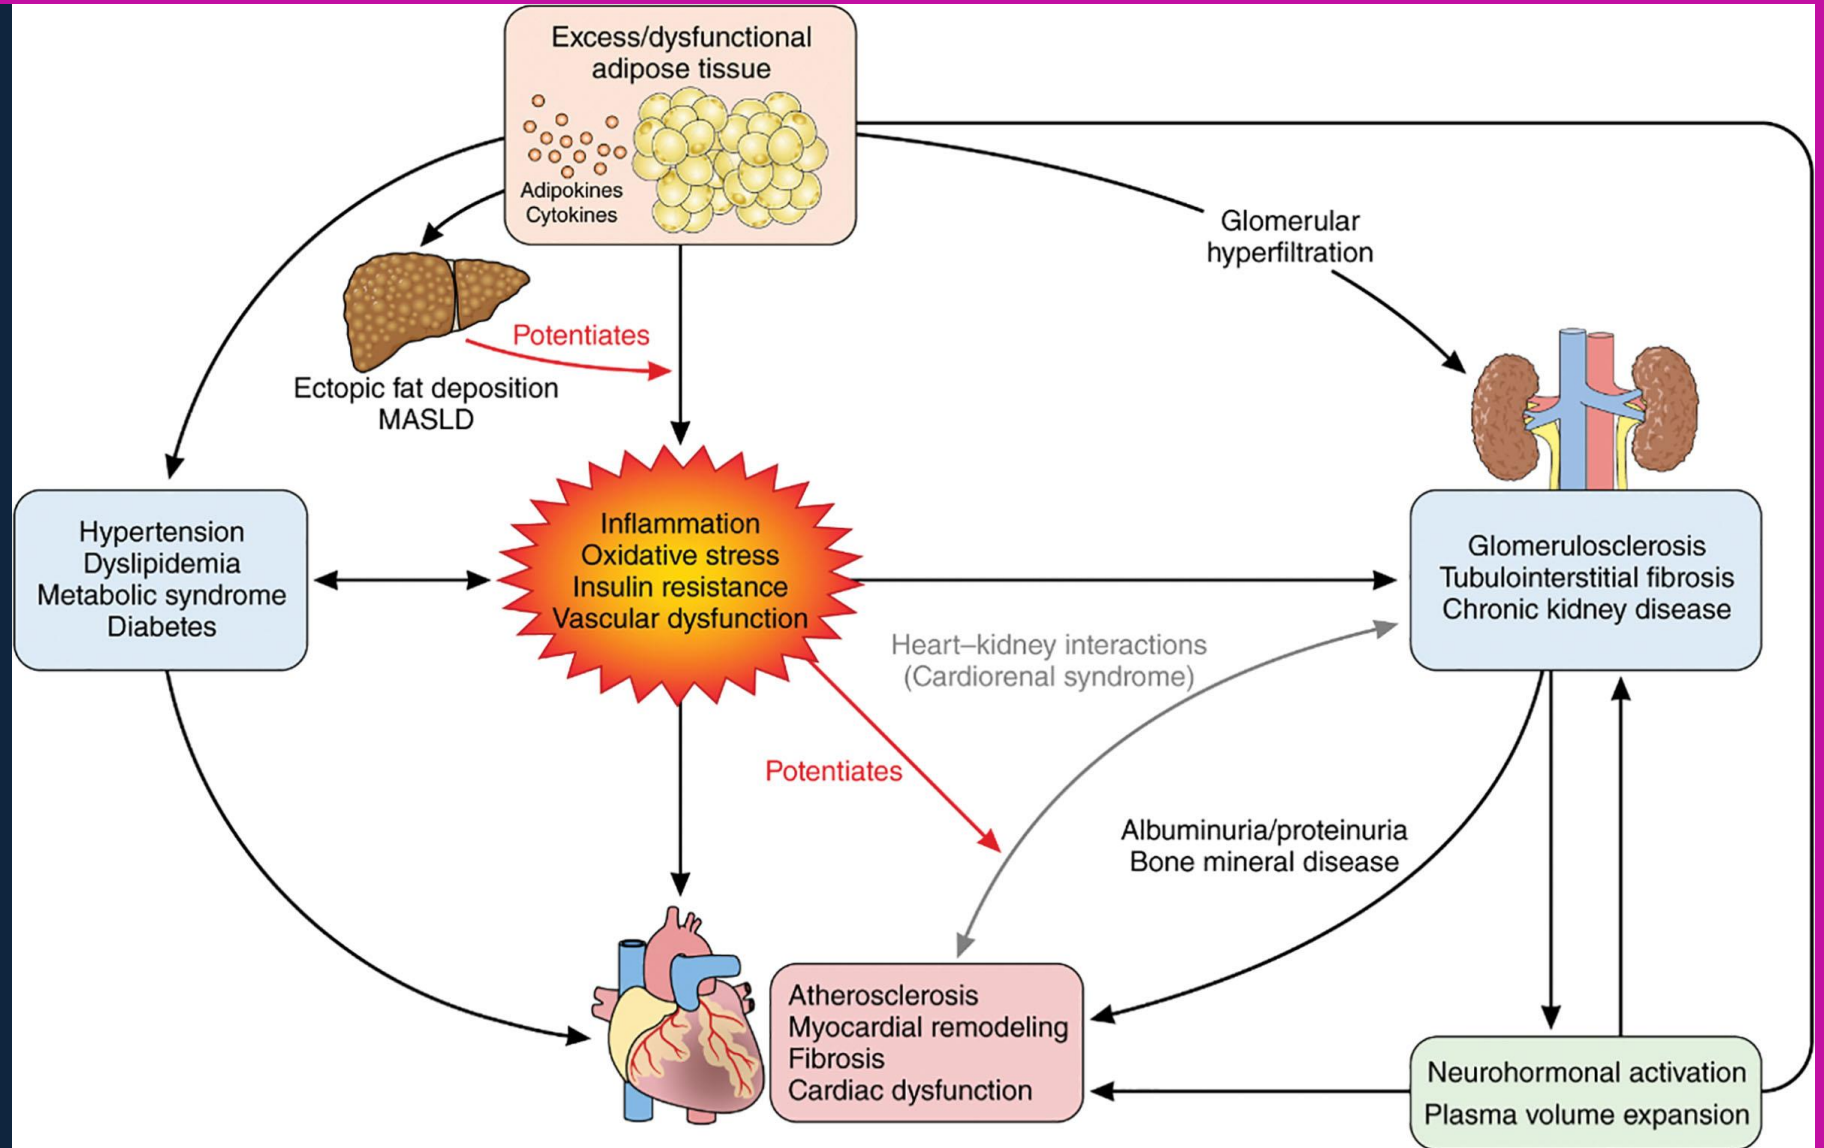

AHA Definition

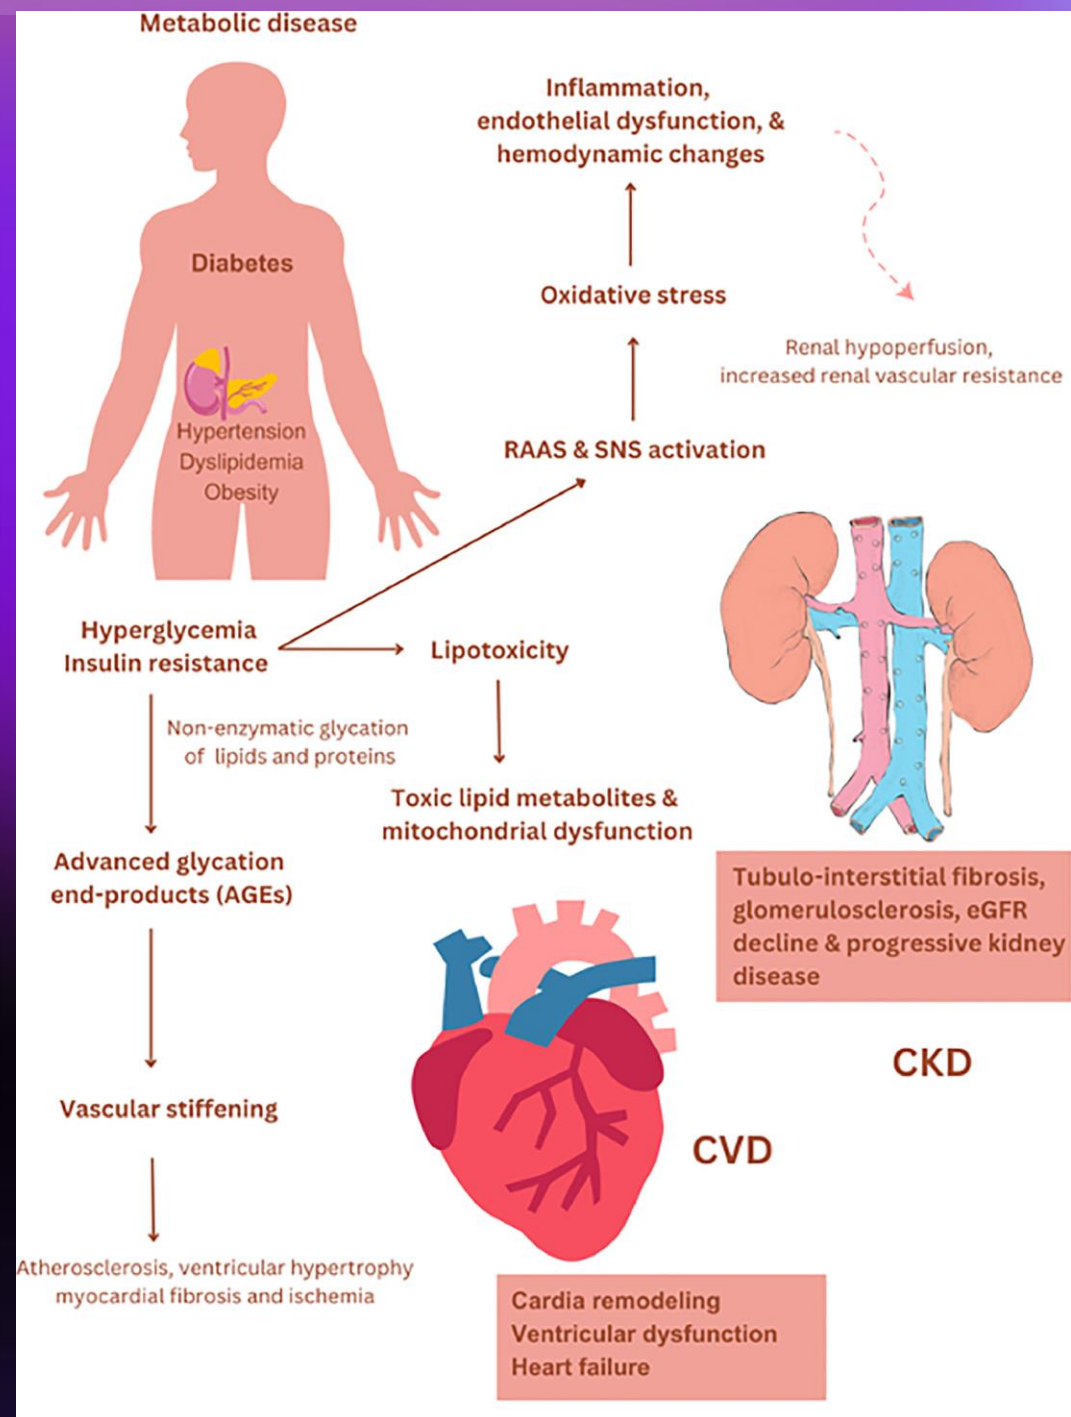

“CKM syndrome is a systemic disorder characterized by pathophysiological interactions among metabolic risk factors, CKD, and the cardiovascular system leading to multiorgan dysfunction and a high rate of adverse cardiovascular outcomes. CKM syndrome includes both individuals at risk for CVD due to the presence of metabolic risk factors, CKD, or both and individuals with existing CVD that is potentially related to or complicates metabolic risk factors or CKD. The increased likelihood of CKM syndrome and its adverse outcomes is further influenced by unfavorable conditions for lifestyle and self-care resulting from policies, economics and the environment.”

Pathophysiology

- **Begins with:** excessive and dysfunctional adipose tissue
- **Leads to:** hypertension, hypertriglyceridemia, MetS, CKD, and type 2 DM
- **Ends in:** coronary artery calcifications, decrease in kidney function, increase in mortality

2022 BRFSS Data Now Available

[View the latest 2022 BRFSS Annual Data](#)

The Behavioral Risk Factor Surveillance System (BRFSS) is the nation's premier system of health-related telephone surveys that collect state data about U.S. residents regarding their health-related risk behaviors, chronic health conditions, and use of preventive services. Established in 1984 with 15 states, BRFSS now collects data in all 50 states as well as the District of Columbia and three U.S. territories. BRFSS completes more than 400,000 adult interviews each year, making it the largest continuously conducted health survey system in the world. [See More.](#)

Summary Points

- **Who:** Department of Health of PR with support of the WHO and PAHO
- **What:** Prior 2 cycle data on obesity + an action plan for prevention of obesity in PR
- **When:** 2016-2025
- **Where:** Puerto Rico
- **How:** “Detener el aumento acelerado en las tasas de prevalencia de obesidad en la población mediante la implantación de acciones multisectoriales”

Underweight:
 $< 18.5 \text{ kg/m}^2$

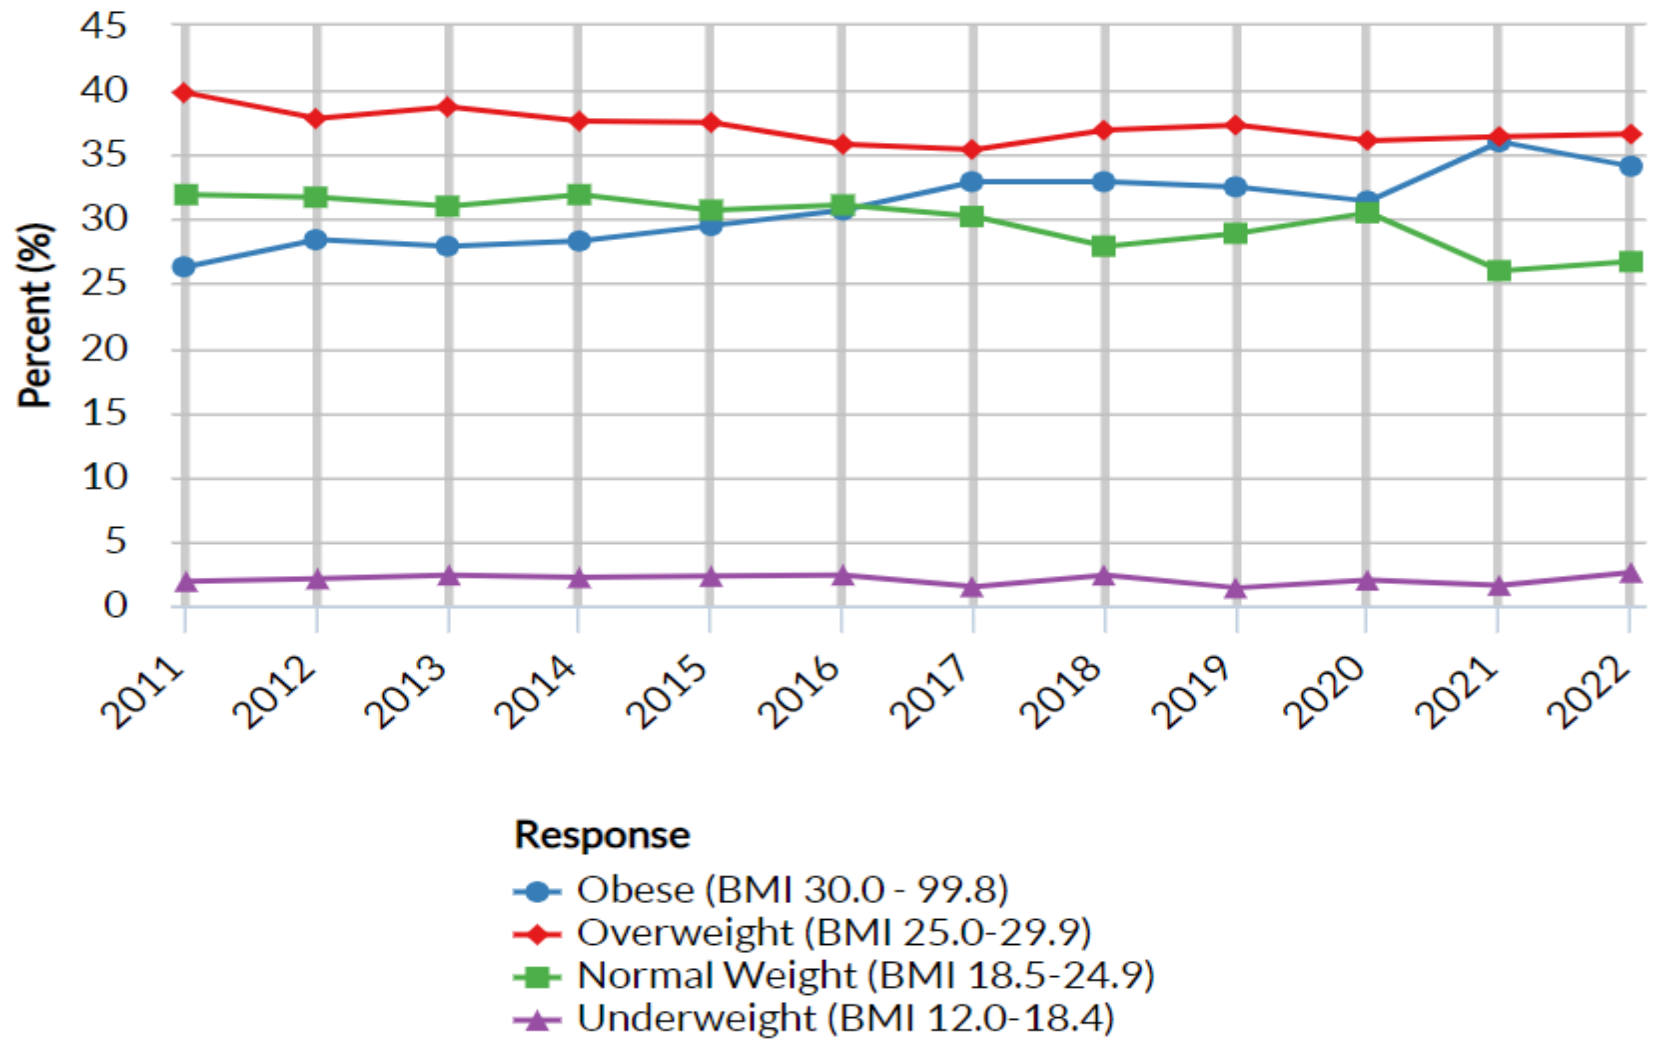

Normal weight:
 $18.5\text{-}24.9 \text{ kg/m}^2$

BMI

Overweight:
 $25 - 29.9 \text{ kg/m}^2$

Obese:
 $\geq 30 \text{ kg/m}^2$
(Severe Obesity: $\geq 40 \text{ kg/m}^2$)

Puerto Rico BMI 2011 - 2022

Data Source: Behavioral Risk Factor Surveillance System (BRFSS)

70.7% of the population of Puerto Rico have overweight or obesity (2022).

Obese: 34.1%

Overweight: 36.6%

Normal weight: 26.7%

Underweight: 2.6%

Figure 12: Age-adjusted prevalence estimates of Obese adults, Puerto Rico 2011-2021

(A) Overall

(B) Gender

(C) Education

(D) Household Income

How does Puerto Rico compare with the United States?

Nationwide obesity rates have more than tripled since the 1960s.

Age-adjusted nationwide obesity and severe obesity rates according to National Health and Nutrition Examination Surveys

This accounts for the population between the ages of 20-74. The obesity category already includes severe obesity.

Source: [Centers for Disease Control and Prevention, National Center for Health Statistics](#) USA FACTS

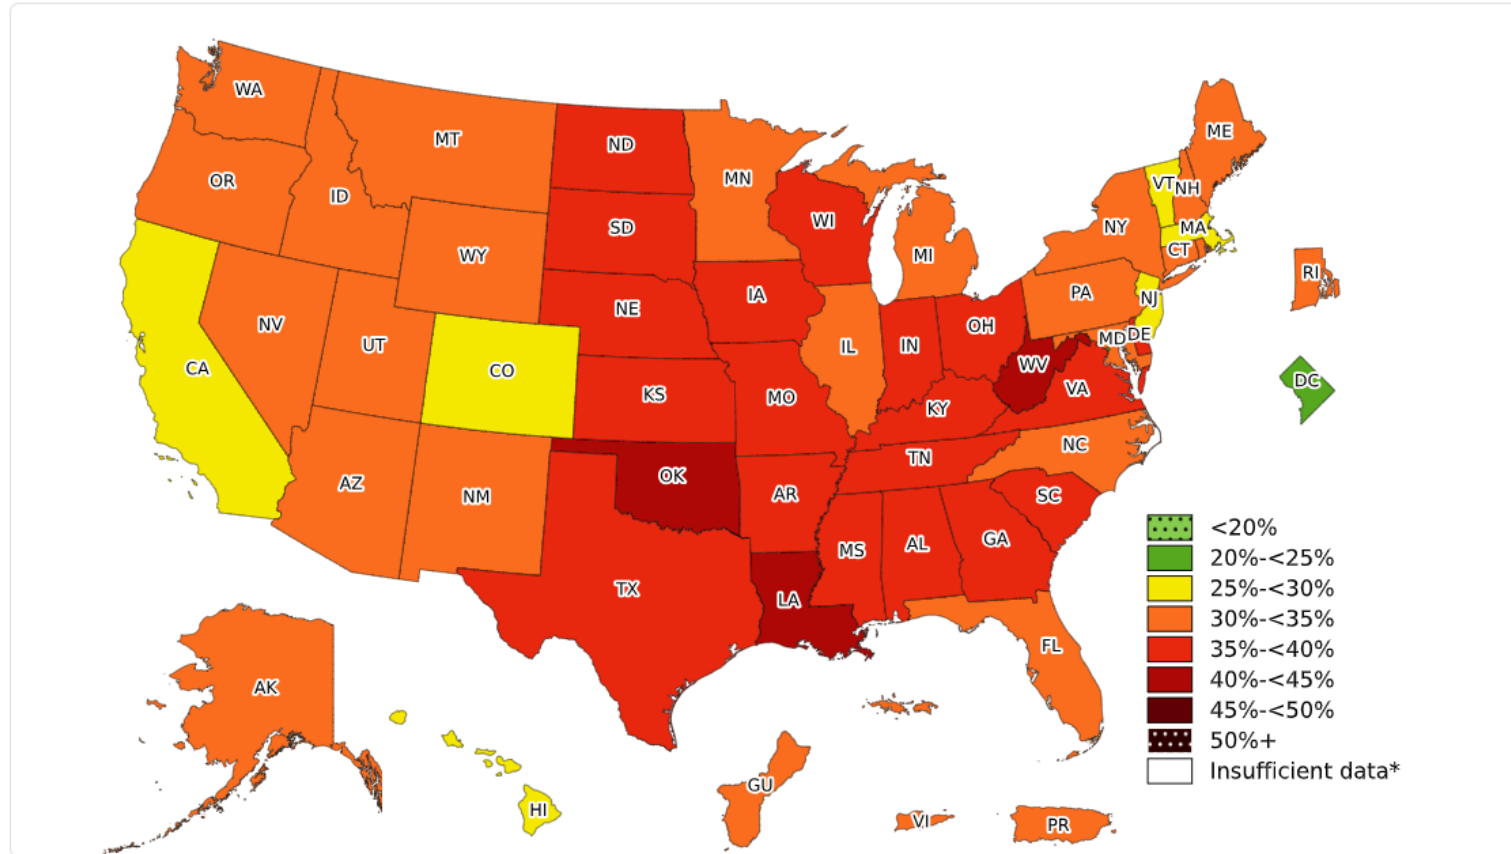

U.S. Adults

- **73.6%** of adults 20+ YO have either overweight OR obesity (as of 2018)
- **41.9%** of adults in the US have obesity (as of March 2020)
 - 9.2% of adults in the US have severe obesity (BMI \geq 40)
- Most affected groups:
 - Non-Hispanic Black adults
 - Adults with less education

U.S. Adolescents + Kids

- 22.2% of adolescents aged 12-19 YO have obesity (as of March 2020)
- 20.7% of children aged 6-11 YO have obesity (as of March 2020)
- 12.7% of children aged 2-5 YO have obesity (as of March 2020)

Map: Overall Obesity

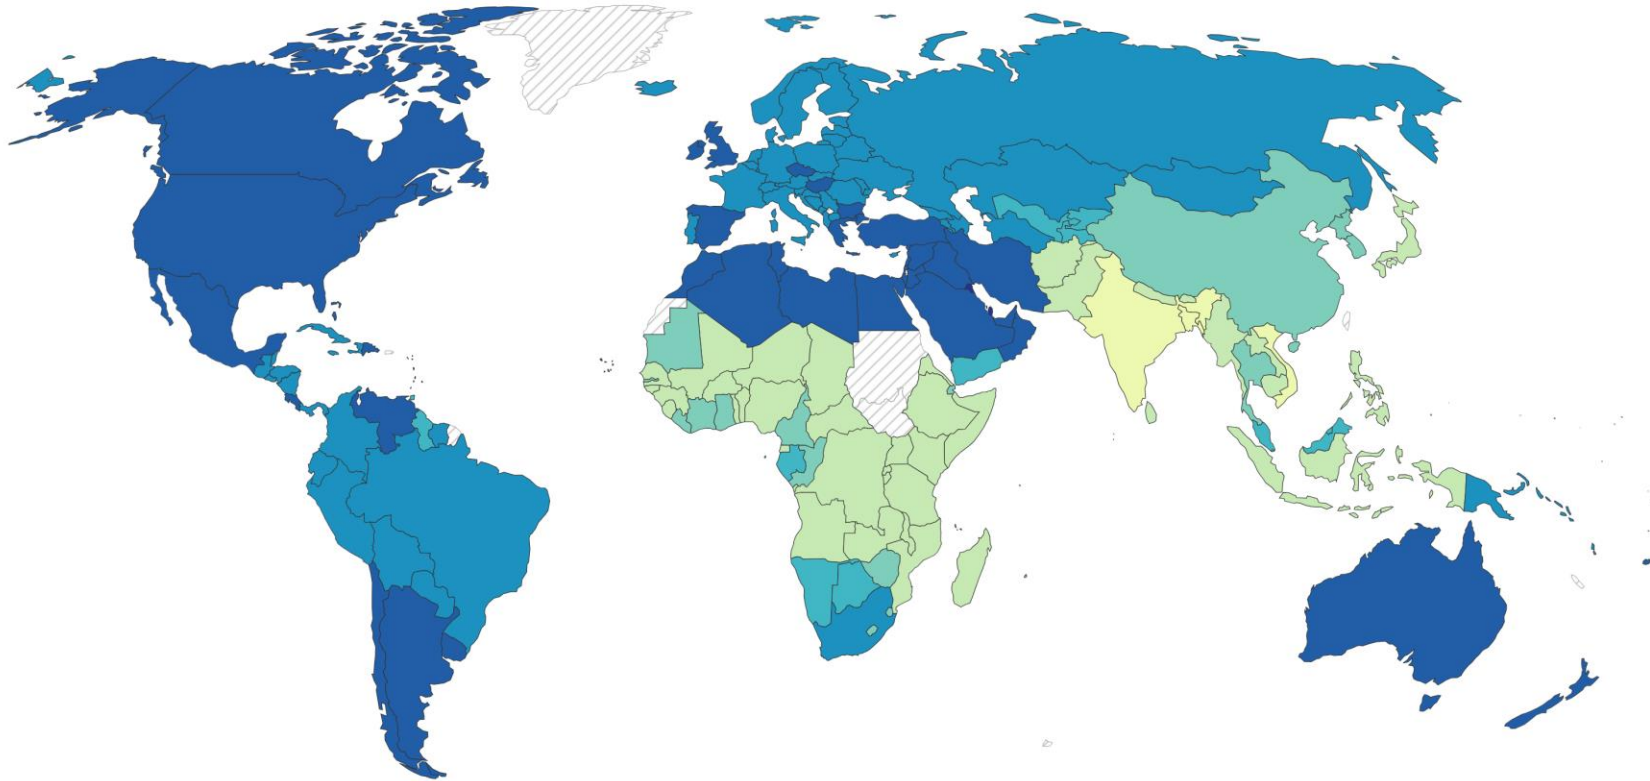

In 2022, more than 1 in 5 adults in all U.S. states and territories had obesity.

Source: [Behavioral Risk Factor Surveillance System](#)

Share of adults who are overweight or obese, 2016

"Overweight" is defined here as a body mass index (BMI) above 25. BMI is a person's weight in kilograms divided by their height in meters squared.

Our World
in Data

Risk Factors for CKM Syndrome

Stages of CKM

Audience Participation!

Stages of CKM

Stage 0

- *No CKM risk factors*
- Normal: BMI, waist circumference, glucose, BP, lipids and no evidence of CKD or subclinical/clinical CVD

Stage 1

- *Excess or dysfunctional adiposity*
- Overweight/obese, abdominal obesity, dysfunctional adipose tissue **without** metabolic risk factors or CKD

Stage 2

- *Metabolic risk factors and CKD*
- Triglycerides \geq 135 mg/dL, hypertension, metabolic syndrome, diabetes, or CKD

Stage 3

- *Subclinical CVD in CKM*
- Subclinical ASCVD or subclinical HF **with** excess/dysfunctional adiposity, CKM risk factors, or CKD

Stage 4

- *Clinical CVD in CKM*
- Clinical CVD (coronary heart disease, HF, stroke, PAD, AF) **with** excess/dysfunctional adiposity, CKM risk factors or CKD

KDIGO Guideline Definition of CKD

CKD is classified based on:

- Cause (C)
- GFR (G)
- Albuminuria (A)

				Albuminuria categories		
				Description and range		
				A1	A2	A3
				Normal to mildly increased	Moderately increased	Severely increased
				<30 mg/g <3 mg/mmol	30–299 mg/g 3–29 mg/mmol	≥300 mg/g ≥30 mg/mmol
GFR categories (ml/min/1.73 m ²) Description and range	G1	Normal or high	≥90	Screen 1	Treat 1	Treat 3
	G2	Mildly decreased	60–89	Screen 1	Treat 1	Treat 3
	G3a	Mildly to moderately decreased	45–59	Treat 1	Treat 2	Treat 3
	G3b	Moderately to severely decreased	30–44	Treat 2	Treat 3	Treat 3
	G4	Severely decreased	15–29	Treat* 3	Treat* 3	Treat 4+
	G5	Kidney failure	<15	Treat 4+	Treat 4+	Treat 4+

Low risk (if no other markers of kidney disease, no CKD)

High risk

Moderately increased risk

Very high risk

“An ounce of
prevention is
worth a
pound of
cure.”

PREVENT Equation

- AHA **PRE**dicting Risk of **CVD** **EVENTS**
- A calculator for providers to use to help predict patient risk
- PREVENT models were based on a total of 46 observational cohort studies and EMR datasets, which included 6,612,004 US adults 30-79 years of age
- The high concordance in risk estimates identified for ASCVD and HF (correlation ≥ 0.9) in the PREVENT equations supports the approach of estimating total CVD as a composite

Exclusion of Race in PREVENT

- It was decided not to include race as a predictor in the development of PREVENT and to use the recently developed race-free equations for eGFR on the basis of serum creatinine (CKD-EPI 2021 [Chronic Kidney Disease Epidemiology Collaboration]).
- This is consistent with the growing consensus to remove the use of race from clinical algorithms broadly in medicine
- **Racism, not race, structures our social and individual lived experiences, is associated with adverse SDOH, and represents a key driver of adverse CVD outcomes**
- Calibration of PREVENT across key sociodemographic subgroups (eg, race and ethnicity, strata of social deprivation index) was carefully assessed and demonstrated good calibration among Black individuals

PREVENT Equation

Screen for CKM Risk

- Assess Life's Essential 8 (dietary patterns, physical activity, sleep duration and quality, nicotine exposure, body mass index, blood pressure, lipids, and blood sugar)
- Consider additional testing as clinically indicated: HbA1c, UACR, etc.

Assess CVD Risk

- Among adults aged 30-79 y
- Calculate: 10- and 30-y absolute risk of CVD, ASCVD, and HF with PREVENT
 - Personalize: In the setting of a clinician-patient discussion, consider risk-enhancing factors for shared decision-making
 - Reclassify: In those at intermediate risk or when there is uncertainty, consider sequential testing with biomarkers or imaging

Determine CKM Stage

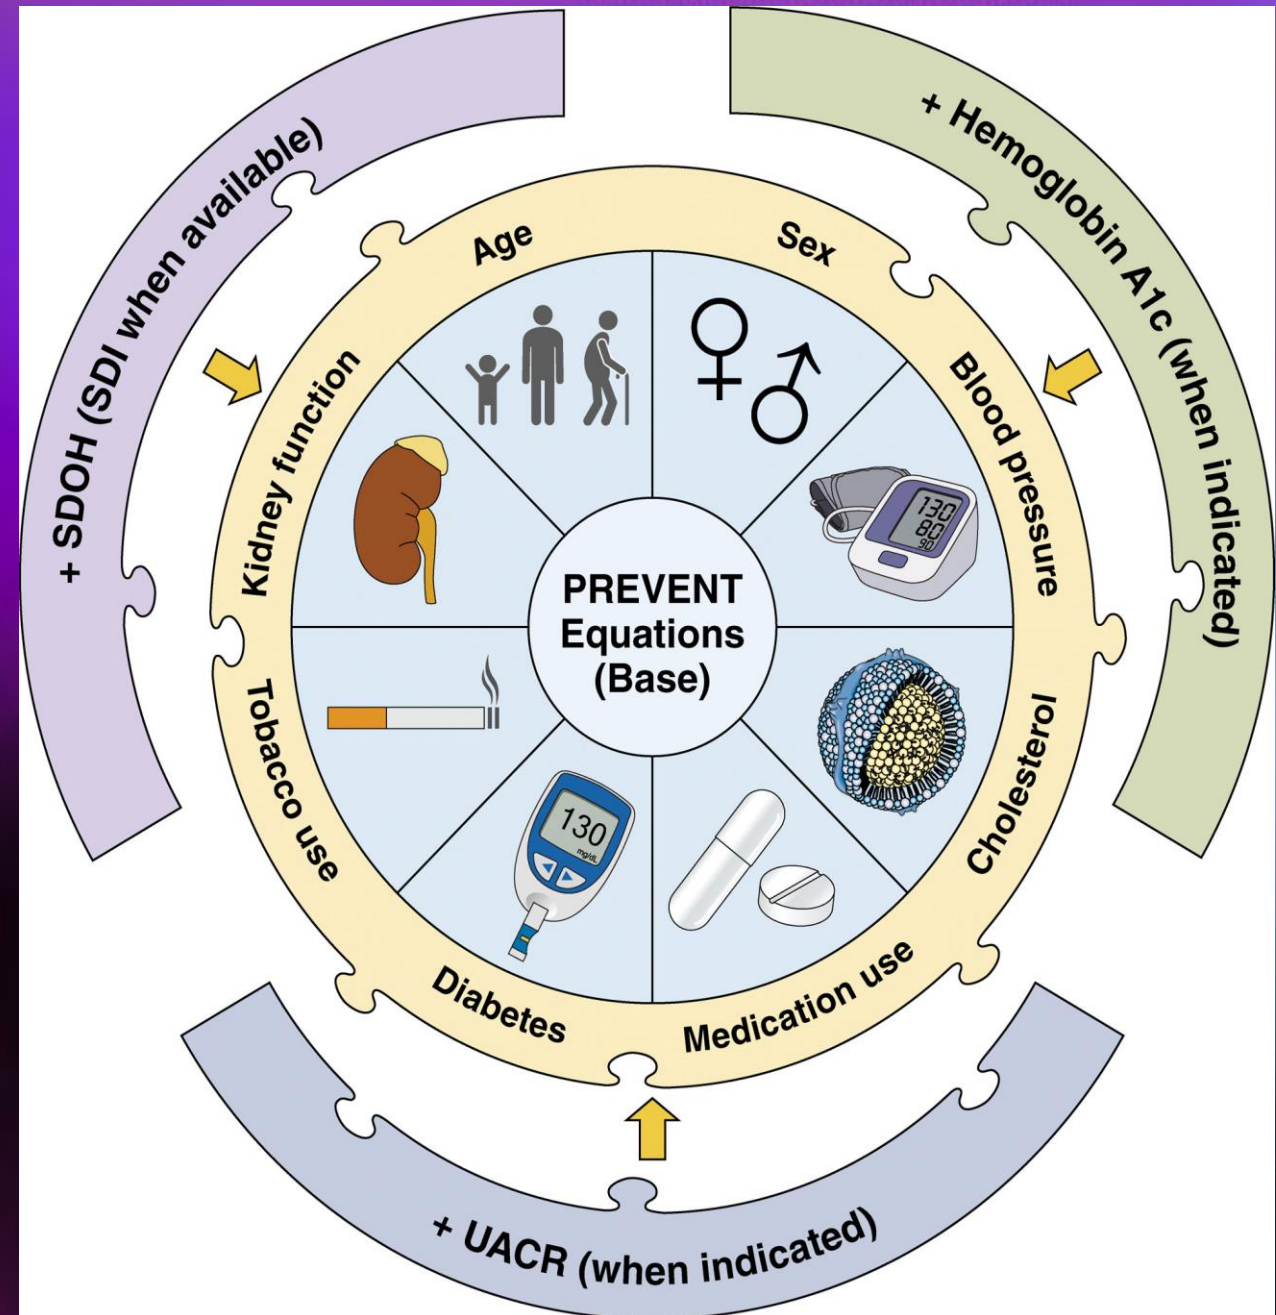

- CKM Stage 0: No CKM risk factors
- CKM Stage 1: Excess or dysfunctional adiposity
- CKM Stage 2: Metabolic risk factors or CKD
- CKM Stage 3: Subclinical CVD, very high-risk CKD, or high predicted CVD risk by PREVENT
- CKM Stage 4: Clinical CVD

Reduce CKM Risk

- Promote CKM health, prevent CKM progression, prioritize CKM regression
- Treat CKM factors and consider cardioprotective therapies according to guideline recommendations when indicated (eg, statin, SGLT2i, GLP-1RA)
- Screen for and address adverse SDOH
- Reassess CKM factors at guideline-recommended intervals

PREVENT base and additional equations:

PREVENT Risk Estimates

CKM Stages	Stage 0	Stage 1	Stage 2	Stage 3
CVD Risk	Low risk	Low risk / Borderline to intermediate risk	Borderline to intermediate risk	High risk

 Low risk  Borderline to intermediate risk  High risk

SGLT2i + GLP1a: Place in Therapy

With DM

 Lifestyle therapy

Physical activity
Nutrition
Weight loss

 First-line therapy

- Additional drug therapy as needed for glycemic control
- GLP-1 receptor agonist (preferred)
 - DPP-4 inhibitor
 - Insulin
 - Sulfonylurea
 - TZD
 - Alpha-glucosidase inhibitor

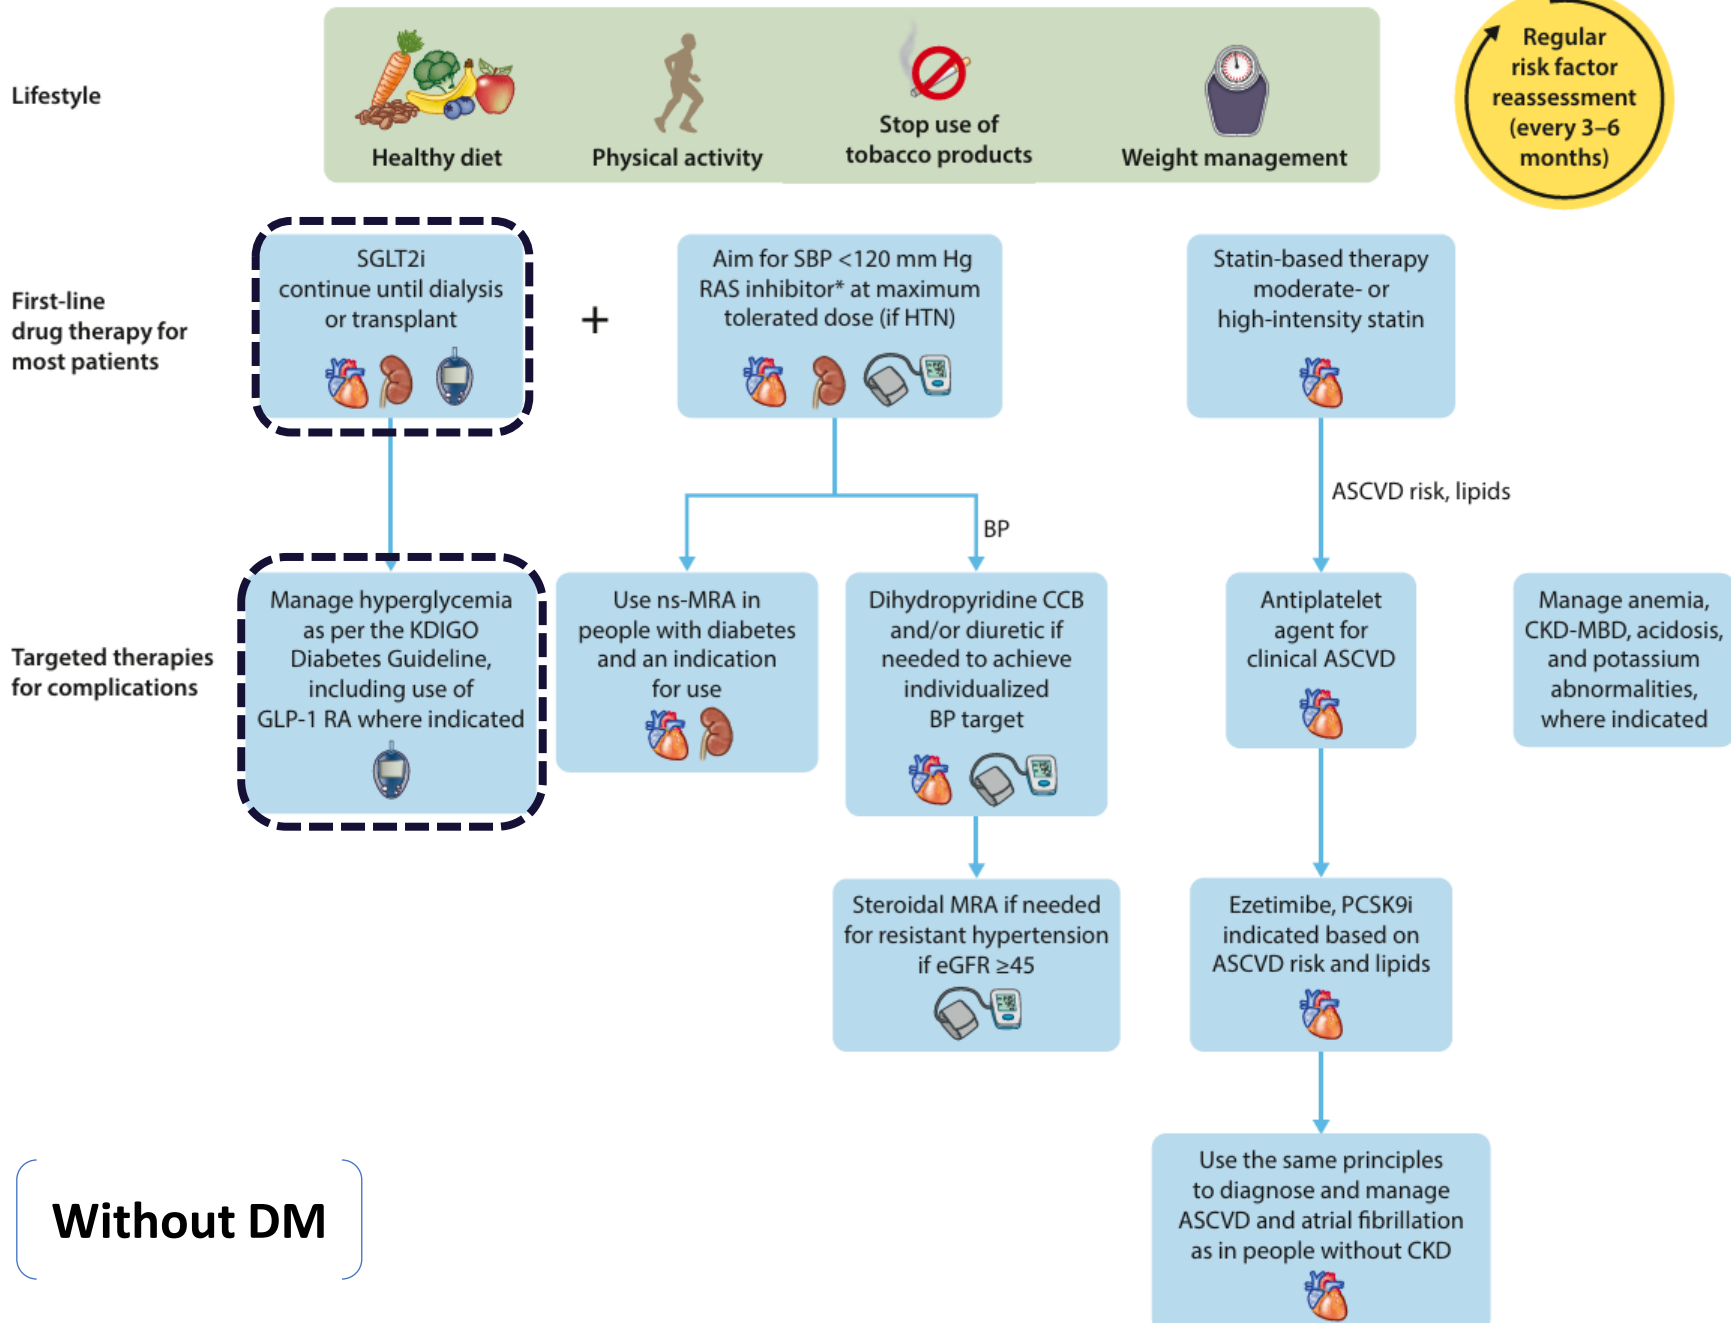

- Guided by patient preferences, comorbidities, eGFR, and cost
- Includes patients with eGFR < 30 ml/min per 1.73 m² or treated with dialysis
- See Figure 25

SGLT2i + GLP1a: Place in Therapy

With DM

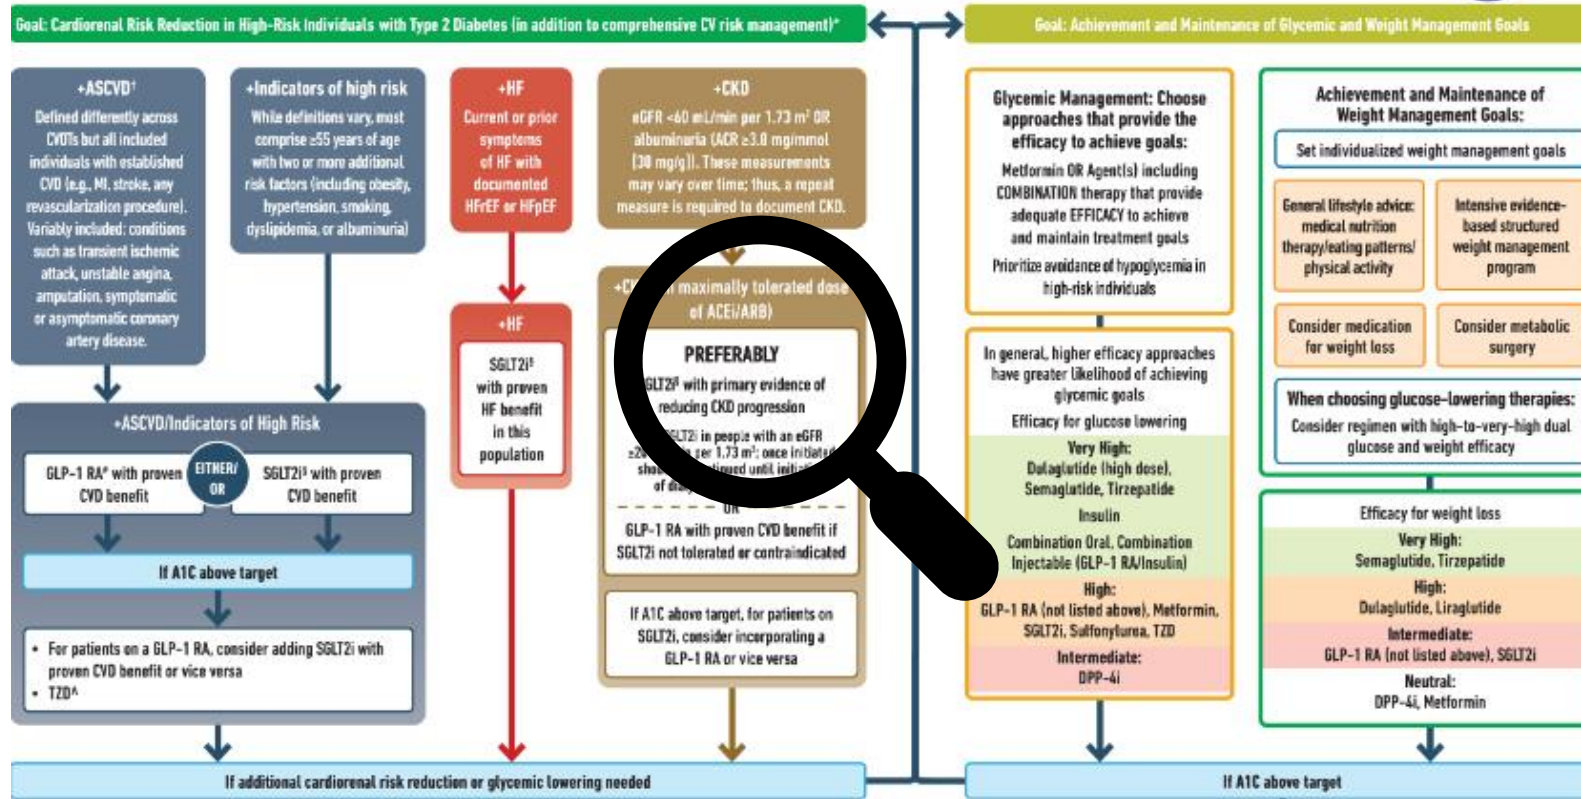

SGLT2i + GLP1a: Place in Therapy

SGLT2i + GLP1a: Place in Therapy

USE OF GLUCOSE-LOWERING MEDICATIONS IN THE MANAGEMENT OF TYPE 2 DIABETES

HEALTHY LIFESTYLE BEHAVIORS; DIABETES SELF-MANAGEMENT EDUCATION AND SUPPORT (DSMES); SOCIAL DETERMINANTS OF HEALTH (SDOH)

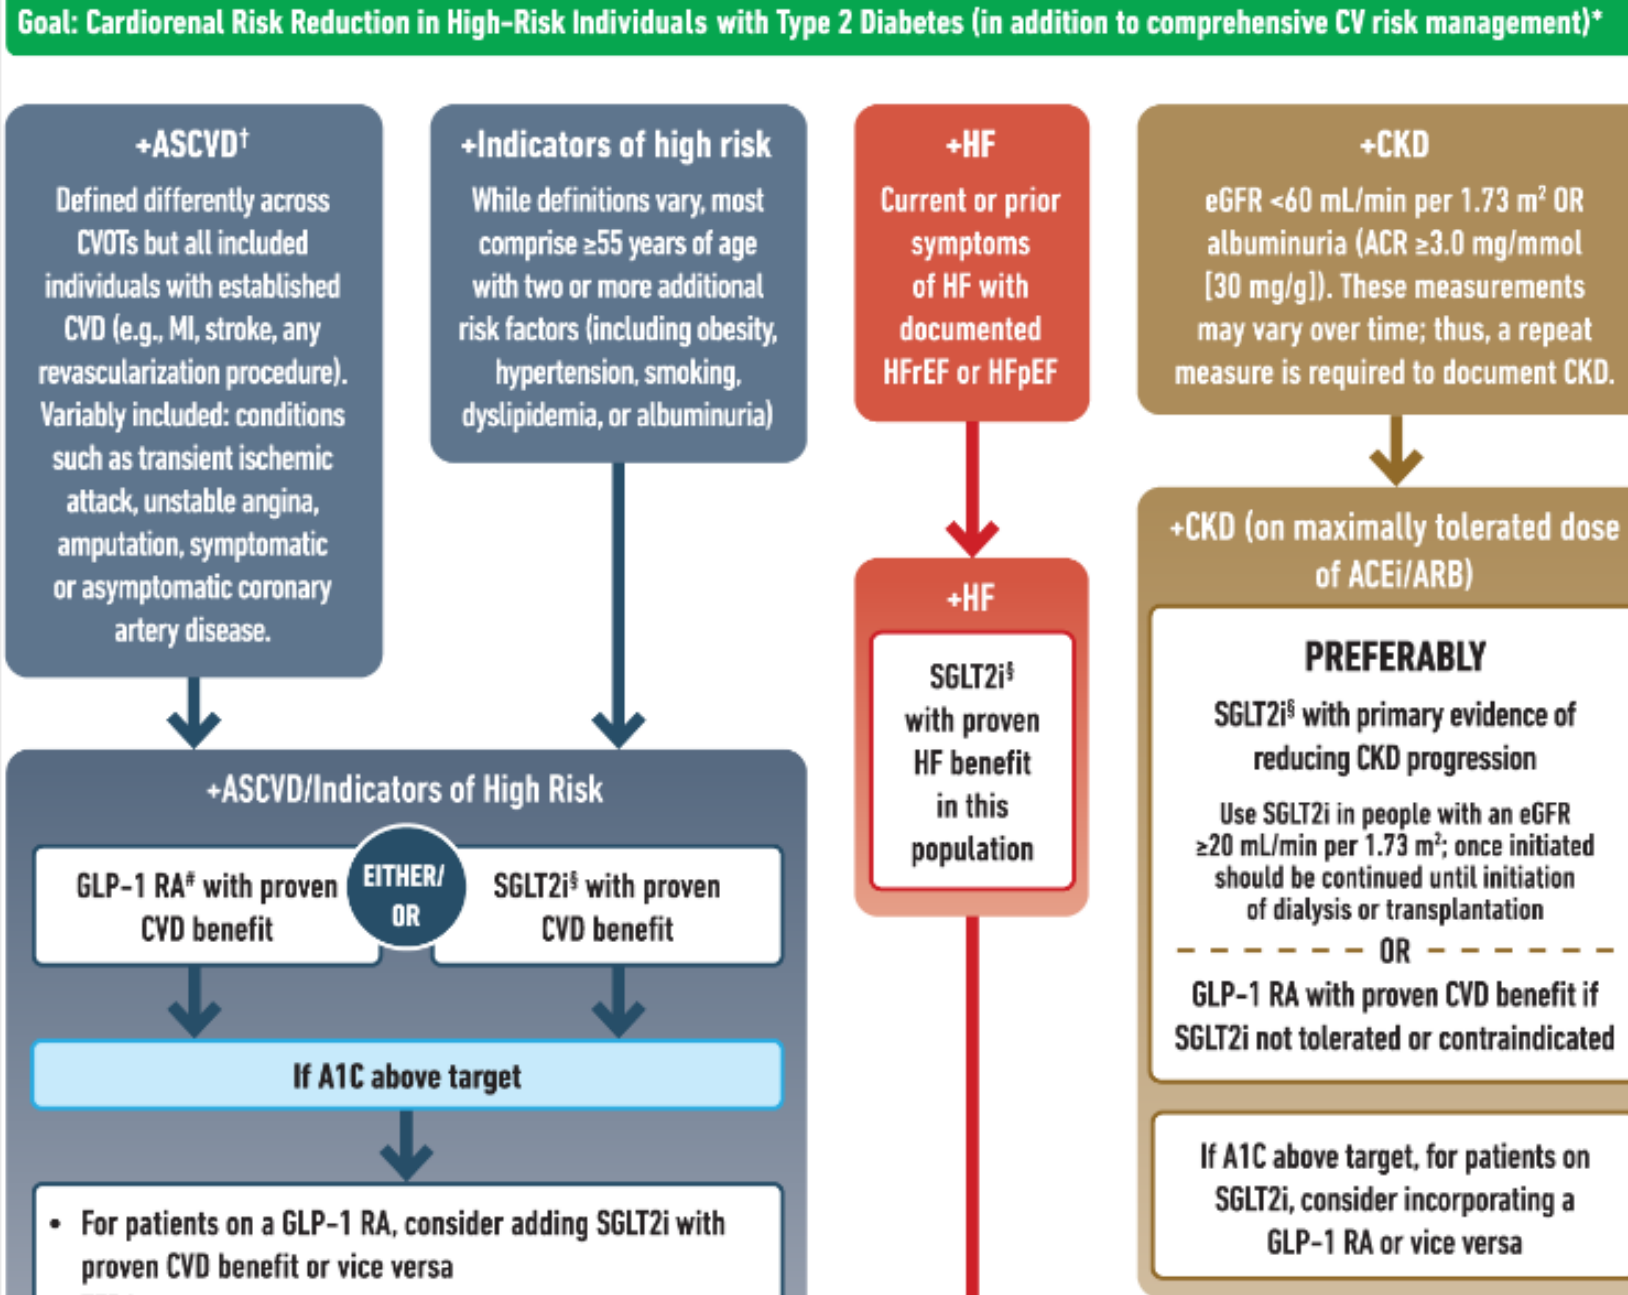

* In people with HF, CKD, established CVD, or multiple risk factors for CVD, the decision to use a GLP-1 RA or SGLT2i with proven benefit should be independent of background use of metformin. A strong recommendation is warranted for people with CVD and a weaker recommendation for those with indicators of high CV risk. Moreover, a higher absolute risk reduction and thus lower numbers needed to treat are seen at higher levels of baseline risk and should be factored into the shared decision-making process. See text for details: [†]Low-dose TZD may be better tolerated and similarly effective; [‡]For SGLT2i, CV renal outcomes trials demonstrate their efficacy in reducing the risk of composite MACE, CV death, all-cause mortality, MI, HFrEF, and renal outcomes in individuals with T2D with established high risk of CVD; [§]For GLP-1 RA, CVDs demonstrate their efficacy in reducing composite MACE, CV death, all-cause mortality, MI, stroke, and renal endpoints in individuals with T2D with established high risk of CVD.

- Identify barriers to goals:**
- Consider DSMES referral to support self-efficacy in achievement of goals
 - Consider technology (e.g., diagnostic CGM) to identify therapeutic gaps and tailor therapy
 - Identify and address SDOH that impact achievement of goals

ADA 2024 Summary:

- First decide using shared-decision making with patient if focus is cardiorenal risk or weight management
- Use flowchart to decide if SGLT2i or GLP1a should be added first
- *Note:* metformin is not always first line agent

ADA 2024 Summary:

- First decide using shared-decision making with patient if focus is cardiorenal risk or weight management
- Use flowchart to decide if SGLT2i or GLP1a should be added first
- *Note:* metformin is not always first line agent

Goal: Achievement and Maintenance of Glycemic and Weight Management Goals

Glycemic Management: Choose approaches that provide the efficacy to achieve goals:

Metformin OR Agent(s) including COMBINATION therapy that provide adequate EFFICACY to achieve and maintain treatment goals
Prioritize avoidance of hypoglycemia in high-risk individuals

In general, higher efficacy approaches have greater likelihood of achieving glycemic goals

Efficacy for glucose lowering

Very High:

Dulaglutide (high dose),
Semaglutide, Tirzepatide

Insulin

Combination Oral, Combination
Injectable (GLP-1 RA/Insulin)

High:

GLP-1 RA (not listed above), Metformin,
SGLT2i, Sulfonylurea, TZD

Intermediate:

DPP-4i

Achievement and Maintenance of Weight Management Goals:

Set individualized weight management goals

General lifestyle advice:
medical nutrition
therapy/eating patterns/
physical activity

Intensive evidence-
based structured
weight management
program

Consider medication
for weight loss

Consider metabolic
surgery

When choosing glucose-lowering therapies:

Consider regimen with high-to-very-high dual
glucose and weight efficacy

Efficacy for weight loss

Very High:

Semaglutide, Tirzepatide

High:

Dulaglutide, Liraglutide

Intermediate:

GLP-1 RA (not listed above), SGLT2i

Neutral:

DPP-4i, Metformin

SGLT2i + GLP1a: Place in Therapy

PAD

2024 ACC/AHA/AACVPR/APMA/ABC/SCAI/SVM/SVN/SVS/SIR/VESS Guideline for the Management of Lower Extremity Peripheral Artery Disease: A Report of the American College of Cardiology/American Heart Association Joint Committee on Clinical Practice Guidelines. *J Am Coll Cardiol.* 2024;83(24):2497-2604.

- In patients with PAD + T2DM, use of GLP1 and SGLT-2 inhibitors are effective to reduce the risk of MACE (Class 1a).

HF

2022 AHA/ACC/HFSA Guideline for the Management of Heart Failure. *J Card Fail.* 2022;28(5):e1-e167.
2023 ACC Expert Consensus Decision Pathway on Management of Heart Failure With Preserved Ejection Fraction: A Report of the American College of Cardiology Solution Set Oversight Committee. *J Am Coll Cardiol.* 2023;81(18):1835-1878.

- HFrEF: SGLT2i (Class 1a)
- HFmrEF: SGLT2i (Class 2a)
- HFpEF: 1st line: SGLT2i (Class 2a); GLP1a add on

CCD (CAD)

2023 AHA/ACC/ACCP/ASPC/NLA/PCNA Guideline for the Management of Patients With Chronic Coronary Disease: A Report of the American Heart Association/American College of Cardiology Joint Committee on Clinical Practice Guidelines. *Circulation.* 2023;148(9):e9-e119.

- In patients with CAD + T2DM, recommend SGLT2i or GLP1a to reduce risk of MACE (Class 1a)
- In patients with CAD + overweight/obesity GLP1a (semaglutide > liraglutide) is recommended (Class 2a).
- In patients with CAD + HFrEF, an SGLT2i reduces CV death (Class 1a)

SGLT2i + GLP1a: Place in Therapy

Primary CAD Prevention

2019 ACC/AHA Guideline on the Primary Prevention of Cardiovascular Disease: A Report of the American College of Cardiology/American Heart Association Task Force on Clinical Practice Guidelines. *Circulation*. 2019;140(11):e596-e646.

- It may be reasonable to add a SGLT2i OR GLP1a to metformin in DM with other ASCVD risk factors (Class IIb).

Atrial Fibrillation

2023 ACC/AHA/ACCP/HRS Guideline for the Diagnosis and Management of Atrial Fibrillation: A Report of the American College of Cardiology/American Heart Association Joint Committee on Clinical Practice Guidelines. *Circulation*. 2024;149(1):e1-e156.

- “In patients with T2DM/HF/CKD, SGLT2i appear to prevent new AF...With only limited or inconsistent data, no recommendations are made for these upstream therapies for prevention of AF”
- No mention of GLP1a

Audience Participation

Which of the following the GLP1-agonists is FDA approved to reduce the risk of major CV events in patients with DM?

- A. Liraglutide
- B. Dulaglutide
- C. Tirzepatide
- D. A + B
- E. All of the above

Audience Participation

Which of the following the GLP1-agonists is FDA approved to reduce the risk of major CV events in patients with DM?

- A. Liraglutide
- B. Dulaglutide
- C. Tirzepatide
- D. A + B
- E. All of the above

Common SGLT2i ADRs

- Genital mycotic infections
- Urosepsis and pyelonephritis (UTI)
- Lower limb amputation
- Diabetic ketoacidosis (DKA)
- Acute kidney injury
- Hypoglycemia

Common GLP-1a ADRs

- Nausea
- Constipation
- Diarrhea
- Vomiting
- Decreased appetite

Missed Doses / Drug Storages

TABLE 2 Considerations for Resuming a GLP-1 Receptor Agonist After a Prolonged Lapse in Therapy

Agent	Last Dose Administered	Recommendation(s) for Resuming Therapy
Dulaglutide*	1.5 mg once weekly 3 or 4.5 mg once weekly	<ul style="list-style-type: none"> • Resume at 1.5 mg once-weekly dose. • Expect comparable tolerability to that experienced prior to dose interruption. • Use best judgment if ≥ 3 doses are missed. <ul style="list-style-type: none"> ○ It is unknown whether tolerance to the GI adverse events will remain if reinitiated at the higher dose after ≥ 3 missed doses. ○ Decision can be informed by patient's prior GI tolerability. ○ In consideration of the above, clinicians may consider reinitiating at 1.5 mg once weekly.
Injectable semaglutide†	1 mg once weekly	<ul style="list-style-type: none"> • If ≤ 2 doses are missed, reinitiate at 1 mg once weekly. • If 3–4 doses are missed, reinitiate at 0.5 mg weekly. • If ≥ 5 doses are missed, reinitiate at 0.25 mg once weekly.
Tirzepatide‡	≥ 5 mg once weekly	<ul style="list-style-type: none"> • If ≤ 2 doses are missed, reinitiate at the same dose (provided the dose was adequately tolerated). • If ≥ 3 doses are missed, reinitiate at 5 mg once weekly.

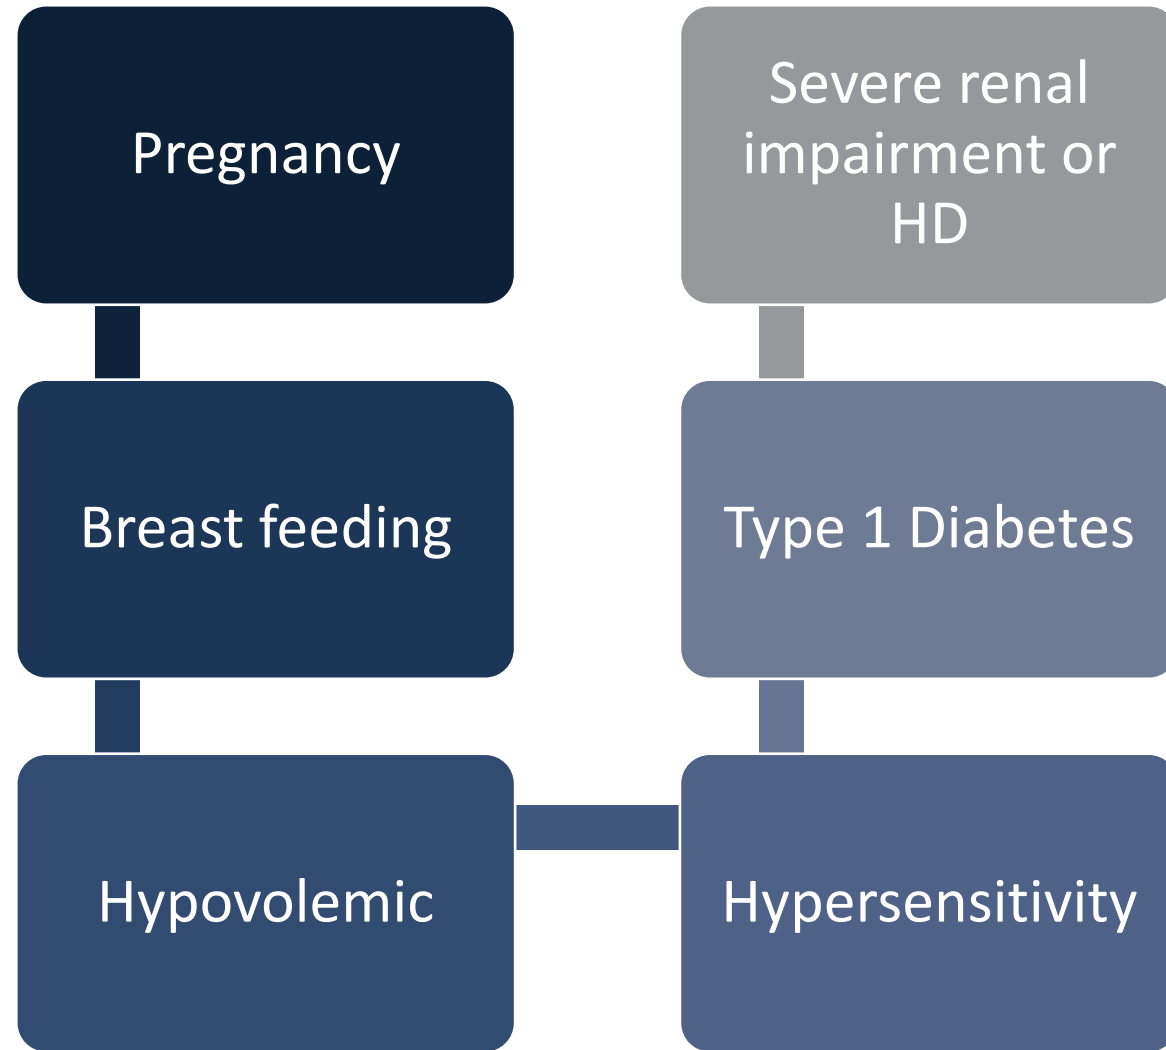

TABLE 1 Manufacturer Recommendations for Missed Doses of GLP-1 Receptor Agonists

Agent	Recommended Dosing Interval	Manufacturer Recommendations for Missed Doses
<i>Short-acting agents</i>		
Exenatide	Twice daily	<ul style="list-style-type: none">• Skip missed dose and resume at the next scheduled dose.
Lixisenatide	Once daily	<ul style="list-style-type: none">• If a dose is missed, administer within 1 hour prior to next meal.
<i>Long-acting agents</i>		
Dulaglutide	Once weekly	<ul style="list-style-type: none">• Administer as soon as possible if there are ≥ 3 days (72 hours) until next scheduled dose.• If < 3 days before next scheduled dose, skip the missed dose and administer on the next scheduled day.
Exenatide XR	Once weekly	<ul style="list-style-type: none">• Administer as soon as possible if there are ≥ 3 days (72 hours) until the next scheduled dose.• If < 3 days before next scheduled dose, skip the missed dose and administer on the next scheduled day.
Liraglutide	Once daily	<ul style="list-style-type: none">• If dose is missed, resume with the next scheduled dose.
Semaglutide (injectable)	Once weekly	<ul style="list-style-type: none">• Administer as soon as possible within 5 days after the missed dose.• If > 5 days have passed, skip the dose and administer on the next scheduled day.
Semaglutide (oral)	Once daily	<ul style="list-style-type: none">• If dose is missed, resume with the next scheduled dose.
Tirzepatide	Once weekly	<ul style="list-style-type: none">• Administer as soon as possible within 4 days (96 hours) after the missed dose.• If > 4 days have passed, skip the dose and administer on the next scheduled day.

Important Points

- Chronic condition = long-term medication
- Rotate injection site
- Check stability for each product especially given frequent power outages/hurricanes
- Same medication, different formulations
 - Ex – Wegovy[®] vs Ozempic[®] single vs. multi-dose pen

Do not
use
SGLT2i
if...

Do not use GLP-1 agonists if...

Type 1 DM

Pancreatitis

Thyroid
cancer

Pregnant

Severe renal
dysfunction

SGLT2i outcomes

GLP-1 agonist outcomes

GLP-1 receptor agonists

Effects on CV outcomes

(HR; 95%CI)

- MACE 0.86 (0.80 to 0.93)
- MI 0.90 (0.83 to 0.98)
- Stroke 0.83 (0.76 to 0.92)
- CV death 0.87 (0.80 to 0.94)

Effects on risk factors

glucose

HbA1 ~ 1.5 %

weight

~ 4%

blood pressure

~ 3 mmHg

Side effects

- GI side effect
- Local reaction at injection side
- Use with caution in patients with history of pancreatitis

Patient profile

- ASCVD
- Overweight / obese
- High risk of stroke

Treatments aspects

- Start with low dose
- Increase dose slowly
- Use \leq 32 gauge needle
- Adjust insulin / SU dose
- Recommend small meals

Group Activity

Instructions:

1. Break into small groups
2. Review the case provided to your group
3. Answer the questions included with your case
4. Choose someone in the group to share/present to the larger group

Pharmacist's Role

- Patient education, patient education, patient education!
- Recognize social determinants of health
- The link between multiple providers, working in silos, not communicating
- Role of primary care in early identification and prevention
- Deprescribing when appropriate
- Expanding role as providers

Post-Test

1. Guidelines are shifting from treatment of diabetes as the only condition to reduction of overall cardio-renal-metabolic comorbidities. **True** False
2. To reduce overall mortality in patients with T2D, sitagliptin is preferred in those with HF or CKD. True **False**
3. In patients with high risk of ASCVD or with established CVD, GLP-1RAs and SGLT2is are preferred agents. **True** False
4. Clinical pharmacists can help identify patients with diabetes who may benefit from GLP-1 RAs or SGLT2is to optimize their glycemic control and provide positive cardiorenal benefits. **True** False
5. Pharmacists can educate team members on the benefits and risks of SGLT2 inhibitors or GLP-1RA beyond glycemic control. **True** False

Educación Continua

1. Log in en tu cuenta de **CFPR.org**
2. Click en **MI CUENTA**
3. Click en **HISTORIAL DE CURSOS**
4. Seleccionar el curso
5. Completar la evaluación y Prueba
6. Guardar o imprimir el Certificado
